

MONITORING PERFORMANCE OF A LOGICALLY-PARTITIONED COMPUTER

ABSTRACT

5 A method, apparatus, system, and signal-bearing medium that in an embodiment
collect a performance metric of a first partition in a logically-partitioned computer. If the
difference between the performance metric and an expected performance metric exceeds a
threshold, then a job or another partition is shut down or suspended. The expected
performance metric is calculated based on the performance that is expected if the first
10 partition is the only partition.
